Pulse — Demo Script, Known Issues & Future Improvements

1. Introduction

This document is for the person running a live or recorded demo of Pulse — whether a stakeholder walkthrough, a tutor review or a pitch. It is written to be followed top-to-bottom: a short demo script that visits every feature in a natural order, a candid list of known issues the audience may run into mid-demo, and a prioritised list of future improvements for the next development team.
Target demo length: 7–10 minutes.
Preferred device: physical iPhone running Expo Go on home or hotspot Wi-Fi (uni Wi-Fi blocks Firebase).

2. Demo Script

2.1 Pre-demo checklist

1. Phone and Mac on the same Wi-Fi (not uni Wi-Fi).
2. npx expo start is running, QR code visible.
3. Test account seeded with ~2 weeks of realistic data (Generate sample data in Profile → Settings).
4. A second test account logged in on a backup device, with the first account added as a friend.
5. One pre-written reflection and one pre-written journal entry queued so you don't freeze on stage.

2.2 Opening — 30 seconds

"Sometimes life gets overwhelming and we lose focus on what's important. Pulse is a mobile app that divides your life into five domains — Spirituality, Family & Friends, Health, Finance, Productivity — and helps you balance them with small, daily, achievable actions."
Open the app to the login screen. Sign in with the test account.

2.3 Privacy & Entry Quiz — 1 minute

- Point out the privacy notice ("short version first, full detail available"). APP-11 compliant consent flow.
- Walk through the first two questions of the entry quiz, highlighting the mood faces and the blue-to-green colour progression.
- Submit the quiz. The app lands on Home with baseline scores populated.

2.4 Home dashboard — 1 minute

- Point out the central **Balance Score ring** — the aggregate of Life Strength and Evenness.
- Toggle between the **radar chart** view and the **domain tiles** view.
- Explain the three daily missions at the top of Home, generated from the user's weakest domains.
- Tick one mission complete; show the indicator update to 1/3.

2.5 Finance domain — 1 minute

- Open Finance from the domain tile.
- Add an expense via the pop-out modal: $25.50, Food. Watch the donut chart update.
- Switch to the **spending calendar**; show today's cell colouring (red over daily allowance, green under).
- Navigate backward to the previous month — show history is intact.
- Switch to the **Saving** tab. Open the "Coffee Machine" plan. Add a $50 saving via long-press; show the plan progress bar move from 5% to 10%.

2.6 Physical Activity Tracker — 45 seconds

- Open My Physical Activities.
- Show a saved **Cardio** entry (running, 10km, 60 mins) and a saved **Strength** entry (squats, 3×15kg×12 reps).
- Open **Templates**; heart-favourite a workout and re-use it with one tap.

2.7 Spirituality — mood & journal — 1 minute

- Open Spirituality.
- Select today's mood from the 5-face scale.
- Pick two emotion tags.
- Add a one-line reflection.
- Submit — the week chart updates with today's dot.

2.8 Productivity — To-do list — 30 seconds

- Add a task: "Finish Pulse handover doc" with high priority.
- Tick it off; watch the Productivity score tick upward.

2.9 Social — 1 minute

- Open Social → Feed. Point out posts seeded from the second test account.
- Like one post; add a comment ("Nice work!").
- Open the share prompt on a domain achievement: show pre-filled text, preview card, "Share to feed" and "Send to friend" options.
- Post it. Show the post appearing on the Feed with the achievement template card.
- Switch to Messages. Open the conversation; send a photo message.

2.10 Progress analytics — 45 seconds

- Open Profile → Progress Analytics.
- Toggle range (4 / 8 / 12 weeks).

- Switch between overall Balance Score and an individual domain.
- Read one of the auto-generated **Strategic Insights** aloud.

2.11 Tutorials — 30 seconds

- Open Profile → Help & Tutorials.
- Replay the "App Overview" tutorial.
- Mention each feature triggers a short contextual tutorial on first visit.

2.12 Close — 30 seconds

"Pulse took a vague Balanced Life concept and turned it into a working mobile app with a custom scoring engine, five domain trackers, a social layer and a daily mission engine — all built from scratch across six sprints by five students."

3. Known Issues

3.1 Environment and infrastructure

#	Issue	Impact	Workaround
K1	Firebase requests silently fail on uni Wi-Fi (ANU-SECURE) — long-polling is blocked.	App shows "Loading…" or auth/network-request-failed on sign-in.	Demo on home Wi-Fi or hotspot.
K2	Single-character typo in .env.local causes silent auth failure.	Looks like a code bug but is config.	Copy values from Firebase Console; never retype.
K3	iOS Simulator on Apple Silicon has a known Firebase JS SDK persistent-cache bug.	App may freeze on first Firestore write.	Test on physical phone from day 1. We ship with memoryLocalCache().
K4	First TestFlight build showed white screen — .env.local not available in cloud builds.	Fixed by adding Firebase credentials to eas.json.	Env vars must be in eas.json for cloud builds.

3.2 Feature-level issues

#	Feature	Issue	Severity
K5	Physical Activity — Strength	Saved activity displays "15 × 12" with no units.	Medium
K6	Physical Activity —	Must manually add	Medium

#	Feature	Issue	Severity
	Strength	each set individually.	
K7	Physical Activity	No visual indication of mandatory fields.	Medium
K8	Physical Activity	Cannot delete an existing activity record.	High (fixed in physical_user_test_improvements)
K9	Saving Plan	Long-press to add savings is undiscoverable.	Medium
K10	Saving Plan	X button removes entire entry rather than clearing amount.	Low
K11	Social — Sharing	Share-to-friend blocked without a mutual friend connection.	Demo blocker — use prepared second account.
K12	Budget Tracker	No confirmation dialog before expense delete.	Low
K13	Finance Domain	Rendering issue if ScrollView import missing.	Resolved
K14	Social	Comment delete button positioned inconsistently on narrow screens.	Low (fixed in test_fix_sharing_issues)
K15	Android	Icon in Text with borderRadius broke baseline — missions pills distorted on Android.	Fixed by View row + includeFontPadding: false

3.3 Scoring edge cases

#	Issue	Impact	Status
K16	Reflections-only entries used to drop score slightly.	Now hold previous week's score steady.	Fixed Sprint 5
K17	Repeatedly opening app in same week recomputed score, causing drift.	Week-start scores now frozen in weekStartScores.	Fixed Sprint 5

#	Issue	Impact	Status
K18	Toggling to-do complete/incomplete/complete awarded points each time.	Idempotent logAction with stable event IDs.	Fixed Sprint 5; regressed in physical_user_test_improvements — needs re-fix

3.4 Account and auth

#	Issue	Impact	Status
K19	Email verification does not gate access.	Users can enter app without verifying email.	Open — needs auth-observer emailVerified check
K20	Avatar upload path mismatch with Storage rules.	Avatar edit silently fails in production.	Open — add /avatars/{uid} rule
K21	Password change succeeds with only one password field filled.	Risk of unintended empty password.	Open — require paired fields + min length

---

4. Future Improvements

4.1 High priority (release blockers)

1. **Enforce email verification before granting app access.** Related: K19.
2. **Fix avatar upload Storage rules.** Related: K20.
3. **Add real email authentication / verification links.**
4. **Keyboard covering input fields on mobile.** Use KeyboardAvoidingView consistently.
5. **Harden handleConsentComplete in App.js** with try/catch/finally.
6. **Firestore rules audit.** New collection paths need rule coverage; users/{uid} is currently readable by every authenticated account.

4.2 Medium priority (UX polish)

1. Physical Activity Tracker — strength improvements (units in display, "Number of Sets" field).
2. Required-field indicators in all forms.
3. Discoverable saving-plan entry — floating action button or tooltip.
4. Clarify saving-entry row X button — rename or add confirmation.
5. Carousel / grid sharing — allow template + photo in the same post.
6. Movable messaging pop-up — read feed while chatting.
7. Social — username search instead of email-only.
8. Adopt React Navigation for deep links and state restoration.

4.3 Lower priority (wishlist)

1. Daily Recommendation Engine v2 — per stakeholder vision.
2. AI Fitness Planner — needs paid AI credits.
3. Step counter, sleep, heart rate via HealthKit / Health Connect.
4. Meal plans and diet/calorie tracker.
5. Location-based "catch up with friends" reminder (whitelisted).
6. Firebase Storage Blaze plan for sustained image sharing.
7. CI/CD pipeline for TestFlight builds + Jest on push.
8. Dark mode / theme preferences.
9. Expanded test coverage; fix the Jest/Babel config blocking two suites.
10. Trademark / IP review of "Pulse" name and AI-generated icon.

4.4 Operational / handover

1. Document environment variable requirements for cloud builds (related: K4).
2. Set up external TestFlight testing earlier — Apple review adds delays.
3. Migrate scoring and mission engines into a @pulse/core package.
